DIA DECLASSIFICATION/RELEASE INSTRUCTIONS ON FILE

Approved For Release 2001/04/23 : CIA-RDP62-00328A000100160003-0 IB-949-58 Great Brit.in AIR INTELLIGENCE INFORMATION REPORT 11 June 1958 Air Attache, London, England SIGN OF THE WATER 11 June 1958 TURNOVER CLINTON S, ADAMS, Captain, USAF Office of the Air Attache property of a contract to a second property of the contract of BAIR 600 Synthetic Materials in Aircraft Construction 1. Major General (Engineering Sciences) A. Tumanov wrote in Sovietskava Aviative, 25 May 1958, of the use of synthetic materials in aircraft construction. Brief comments were made about the TU-104, TU-114, IL-18, and AB-10. According to the author, these materials may be used in the form of glass fibers made into a foam plastic for structural strength or a glass textolite for soft fuel tanks. Other items mentioned included perspex for aircraft windows, the use of synthetic glues for bonding metal to metal or non-metallic materials to metal, and epoxide a synthetic reain for metal coating. 2. Comments: This article discusses in a very general way the use of synthetic materials in aircraft construction and may be useful as background information. Colonel, USAF Asst. to the Air Attache 13- BO Abridged Translation of Synthetic Materials in Aircraft Construction (4 cys) MARKING: This decreases authors information adecting the national defendage Laws, Title 18, U.S.C., Section 793 and 794. Approved For Release 2001/04/23 10/ARDP62:00328A000100160003

By M. jor-General, Engineering Services, A. Tumanov.

bovetrruya Aviatsiya, 1958, May 25.

Abridged Translation

Obenistry plays a very important role in aircraft construction. Production of modern aeroplaces is unthinkable without using a great variety of synthetic materials and plastice. Even during the second world war a very high strength timber plastic, "delta-timber", was used for the again stress components of fighter aircraft. The propeller bliess for the aircraft are else being made of a timber plastic. Combined with other naterials it is used for the interior of the new pastoners plants fullula. II-18, in-10 and Tu-114.

In modern aircraft so-called form plastice are extensively used, the weight of which is seny times smaller from even to their smaller form sound insulation properties, they can be used as fillers for internal walls and panels.

control rudders, it is frequently almost impossible to ensure adequate rigidity and is this case self-feating plantist assemble postul. Introduction of a certain quantity of cust plantics into a closed volume and subsequent heating ensures uniform filling of the entire volume, a strong bond of the foam layer with the metal and a high rigidity of the design.

Personned form layers are obtained in which veneer, glasstertolite and various sheet setals are used. Such reinforced feet layers are successfully used as fillers in panels faced with veneer in the passenger sireraft Tu-lot, Tu-II., II-18; in addition to increased __zidity and strength, these suterials ensure a sensiderably reduced reight.

It is not know that the problem of reducing the miles

Meduction by even 0.02 for the specific weight per cubic tentimetre of the foam plastic used in the above mentioned aircraft would enable the saving of hundreds of kg of weight in very large hiroraft like the Tu-lla. According to Seviet Divil Air line data reduction of the weight of a passence sizeraft by paly 1kg produces an annual adequate in the the reduction in weight by 500 kg for 100 aircraft leads to an annual economy of about 60 million roubles.

Placetee based on glass febric, glass fibre and various regime of high securic strength and a number of other properties are extensively used in aviation engineering samulacture of large components from glass-textolite by the method of a color of ying polyestor hadd a color color of the col

with artificial resins new thornally stable plastics are obtained from which various parts of aircraft instruments and components are produced by high pressure pressure.

Perspex is used for atrepart pintous this natural has good optical properties, a les opecific gravity and permits producing components of may configuration and it is stable to the effects of atmospheric conditions. A disadvantage of this naterial is its high sansitivity to stress concentration. The repently developed method of two-exial orientation of the perspex by Acestic 11 at a programme exceeding the solvening point of glass examined obtaining a qualitatively new material, without any change in chemical composition, which is free of the above mentioned defert. Symbolic universal and special places are available which have a strong achesien to nevel and which make gluing one of the seas-reliable and to many owner the only presticable series of joining non-metallic materials with messis; The emergence of such Sines has anabled for the first time the use of glues for joining setals with actal. Gluing of metal components climinates the dieseventages brought about by rivetting, welding and coldering and, therefore, this pethod is being used on an increasing geals in avisting and to taget presented of Section of the

Recently, gives have also been used on a wide scale in complicated designs with fillers when manufacturing friction discs for wheels and slap for producing glued-weldes and glued-rivetted joints for aircraft and helicopters.

Application of gived joints in the nameseture of belieffeer blades engine improving the quality and increasing their lifetims and to double and even more.

Local stress concentrations which occur around rivets, weld spets, etc. distribute uniformly throughout one nurface of the jets in the case of glued joints and thereby andless elections of the series are uniqued a surface which is assetted to the last the case of the series and the series of the series and the series of the series which the series of the series of

siroraft, the meeting can be unlied directly to the socialist sheathing without using any primer foil varnish or simpled sinc chromate primer). Use of such deping system in modern aviation permits a naving of hundreds of tons of primers and downs of tons of vegetable cits required for membrackwing

It is not possible to enumerate within a short article the great variety of synthetic materials used for sirreraft construction but the few examples show clearly the importance of plastics and other synthetic materials in aviation engineering.

Communist Party on acceleration, the development of the chemical industry of particularly of the ma facture of synthetic materials is of great national importance in the Soviet Union.
